

TRAVEL ALONG THE COASTLINE EXPERIENCE THE BEAUTY OF LOCAL WILDLIFE

LIME produces fragrant and nectar, the medical herb lime blossom. It is important honey plant for beekeepers. Lime blossoms in the end of June.

COMMON ASH is a large deciduous tree growing to 15m with a tall, narrow crown. Ash is particularly associated with basic soils on calcareous substrates on breakages and river banks.

ELM mostly grows on rivers banks near brooks or on rock terrace where soil is rich in nutrients, often clayey. Old big trees are important for several rare wood-rotting fungi.

FLYING SQUIRREL is a small nocturnal rodent. Glides over distance of 30-40 m. Nests are in woodpecker's holes. The most important food are the catkins of alder and birch in winter and leaves and buds of deciduous trees in summer.

OAK is a long-lived tree, it may naturally live to an age of a few centuries. Flowering in June. Jays and squirrels takes acorns and burying them elsewhere. A lot of oak sprouts grow up on the edge of forest.

TOOTHWORT is a parasitic plant living on the roots of hazel and alder, on which it is dependent for its nutrition. Branched underground stem closely covered with colourless leaves lacking of chlorophyll. Flowers in May. Rare. In Red Data List of East Fennoscandia and Red Data Book of Leningrad Region.

OSPREY is a large raptor, reaching 1.8 m across the wings. Its distribution depends on suitable fishing area. Fish is first sighted when osprey is 10-40 m above the water, then osprey hovers and plunges feet first into the water. Our ospreys winter in tropical Africa.

WHITE-TAILED EAGLE is the largest North European raptor. Wings are broad and dominate the silhouette. The breeding pairs are very traditional, and several territories have been in use for centuries. Its diet consist of fish, birds and mammals.

COMMON GOLDENEYE is a diving bird that forage underwater (insects, molluscs, fish eggs and plants). They themselves may fall prey to harriers, hawks and mink. Natural tree cavities chosen for nest and they will readily use nest boxes as well.

LESSER BLACK-BACKED GULL measures 60 cm, 150 cm across the wings. The call is a "laughing" cry. They are omnivores and will eat fish, insects, molluscs, seeds and berries, small mammals, birds eggs and chicks. Nesting seasons begins in May. Wintering in equatorial Africa.

BEACH PEA is a perennial plant growing trailing stems to 50-80 cm long, typically on sand and gravel storm beaches. Pods are poisonous. Beach pea is a legume native to coastal area of Asia, Europe, North and South America.

CURLEW is a wader, feed on invertebrates by pecking and deer probing with its downcurved bill in mud or sand. The familiar call is loud "curlew-o". Males and females look identical. Nest on a ground.

SEA SANDWORT has a circumboreal distribution. This succulent forms patches on sand and shingle above the high water mark of beaches. Leaves are rich in vitamin A and vitamin C and can be used as green leafy vegetable either raw or cooked.

Visit sandy beaches, rocky shores, dunes and wetlands!

Come over to see the spectacular variety of coastal landscapes and unique wildlife. Get ready to watch for migratory flocks of chaffinches and robins or swans resting on shallows. Walk away to find wild orchids in bloom and butterflies glittering over the grassland. Visit the beautiful lakes where colourful dragonflies skimming over the water surface.
